What's New in the MicroStrategy Analytics Desktop?

MicroStrategy Analytics Desktop is a free business intelligence application. The tool contains a set of features allowing you to perform various tasks with business data. The file backup feature allows you to save the state of your database. This means that you won't lose your work while performing an updating or a deletion, but this feature has one drawback: the application won't close on its own, so you will have to click on the "X" on the top-left corner of the window. The dual field windows function shows two versions of a database table, where the left window is the normal display of the table and the right one is the result of a calculation on the selected field. The statistics window displays basic information on the database, such as the number of tables or the amount of data in each of them. The columns and rows of the various table windows can be rearranged and resized at will using the mouse. The database window allows you to see the database file's properties, while the table window displays the relevant fields in the selected table in a standard way. You can use the ALTER TABLE... command to change the structure of a table. The report viewer enables you to preview the results of queries. You can filter the content displayed in the window and change the view so it's quite easy to get a good view of the information. The undo/redo feature allows you to roll back and redo your last action. The block view shows a list of your database files, each of which

can be independently compressed or frozen. The map viewer function allows you to create a map. This is a very useful feature that allows you to quickly see the geographical distribution of your data. The plug-ins window has a separate section for each type of application available, including object relationships and the OpenOffice suite.
