Field of the Invention The invention concerns a processing device for a plurality of data, in particular for a video camera which comprises a processing unit. The processing unit has a memory which is arranged to store the data and in which a statistical model is located. The invention can be applied in the field of digitising video. The video signal processed in the video camera, which includes a luminance signal and two chrominance signals, can be transmitted e.g. via a telephone line. The digitisation of the video signal results in a digital representation of the video signal. The digital representation of the video signal can be transferred to a video recorder, video player, etc. In the digital representation of the video signal, the video signal is recorded as data strings. The data strings represent the digits, i. c6a93da74d
