It has been known for at least the past 150 years that various natural materials have a broad spectrum of therapeutic activity, and while many different natural materials have shown such activity, none has found wide spread application. This may be for a variety of reasons: cost, availability, effect size, or lack of specificity to a target disease. In the case of plant extracts, the active components have been difficult to isolate, identify and characterize for most if not all plants that show activity. Also, more than 10,000 plant species exist, and while a small proportion of these are used, none are used as broadly as minerals, vitamins and pharmaceutical agents. It has been shown that specific minerals show therapeutic activity, and that targeting a single mineral may lead to a broader spectrum of activity than simply targeting a class of minerals as in traditional medicine. In the area of therapeutic minerals, the highest profile examples of success in discovering new compounds have been selenium and vitamin C. Selenium is a trace element, and its beneficial effects on health have been demonstrated for over 40 years c6a93da74d
